### Details

Now that you have created your Assignment 1 HTML page, it's time to make it look good with CSS: width controls, box-model properties, a chosen font, and a color scheme.

Download: **style.css** (<https://canvas.colum.edu/courses/33502/files/5322763?wrap=1>)

([https://canvas.colum.edu/courses/33502/files/5322763/download?download\\_frd=1](https://canvas.colum.edu/courses/33502/files/5322763/download?download_frd=1))

Make sure you place it in the **same folder** as your assignment1.html file. **This is important.**

Read this week's tutorials first (or, simultaneously!) and make sure your page has the following:

1. A controlled width to your `<div id="container">`, and margin space between the container and the viewport edge. Make sure your `#container` remains *centered* in the viewport.
2. A new, **web-safe font** (<https://blog.hubspot.com/website/web-safe-html-css-fonts>) applied to the entire document
3. A unique web-safe font for the `<header>` elements
4. A smaller font-size for your `<footer>` content
5. A background color\* and text color\* for the entire page
6. A background color\* for your `<div id="container">`
7. A unique background color\* for your `<header>` and `<footer>`
8. Box-model properties applied to your `<header>`, `<p>`'s and `<footer>`. You can apply them to the `<main>` if you like.

\* Use hexadecimal or rgb coordinates for your colors. Don't use standard, simple color names.

The 8 items above are the basics. Feel free to add any additional CSS to help make your page look more interesting.
